

The given code was compiled in IntelliJ IDEA.

I have taken the list given on the e-learning and firstly did the in-order traversal of the tree and then the second step was to delete the node (there was nothing mentioned on the webpage regarding the way to do the same, I did the deletion non recursively) corresponding to the node with value 100. Then after the deletion I again traversed the binary search tree in in-order way and got the results in the attached jpeg file.

To run the code from command line :-

```
javac main.java  
java main
```
